SAVE LIVES:
HIGH FRICTION SURFACE TREATMENTS

NATIONAL PAVEMENT PRESERVATION CONFERENCE:
NASHVILLE, TN  OCTOBER 2016
Marquette Interchange Wisconsin
Marquette Interchange West to North Ramp Crashes Before & After High Friction Surface Treatment (HFST)

**TOTALS**
- Before HFST (11/08 - 8/11) 2 years, 10 months - 219 crashes
- HFST Applied - 9/21/2011
- After HFST (10/11 - 8/14) 2 years, 11 months - 9 crashes

- **219 Crashes**
- **9 Crashes**
Kentucky HFST Program
(As of 6/22/2015)

Where to Use HFST:

- Wet weather crash locations
- Curves
- Intersections
- Ramps

Generally applied in short sections to improve spot locations where friction demand is critical.
What is a HFST?

• Extremely polish resistant aggregate
  – Calcined Bauxite

• Polymer Binder with high shear resistance
  – 2 part epoxy
  – Polyester
  – Acrylic

www.atssa.com/Resources/HighFrictionSurfacing/StateSpecifications.aspx
Epoxy Binder Materials

Thin layer that allows for 50% aggregate embedment
HFST Aggregate

Calcined Bauxite
Why Calcined Bauxite?

In-place friction characteristics:

- 65 FN40R
- AASHTO T 242

Some States are using values greater than 65
Reclaim Excess Aggregate
Semi-Automated Installation
HFST Finished Surface
Application Concept for Enhance Friction Surface Treatment

Product to meet the minimum friction demand when $FD = FC$
FHWA Sponsored Evaluation Sections:
NCAT West Curve Epoxy HFST Sections
Asphalt Based Enhanced Friction Treatment

Enhanced Friction micro slurry at NCAT Test Track
Enhanced Friction Micro Slurry

- **Agg Coarse Fraction (+#4)**
  - 50% Limestone / 50% Calcined Bauxite

- **Agg. Fine Fraction (- #4)**
  - Limestone Screenings

- **Binder**
  - Highly Polymer Modified Emulsion
  - Shear resistance
Friction Lifespan

- HFST Bauxite Epoxy
- Reapplied HFST Bauxite Epoxy

Conventional Aggregate(s) Epoxy

Conventional Dense Graded Asphalt
