

# In-Place Recycling in the Federal Lands Highway Program

Mike Voth, FLH-FHWA

**Midwestern States In-Place Recycling Conference,  
August 11-13, 2009**

# Recycling & Reclamation Methods Used

- ◆ Cold In-Place Recycling
- ◆ FDR pulverize
- ◆ FDR with cement
- ◆ FDR with foam
- ◆ FDR with emulsion

# In-Place Recycling in FLHD

6.8 Million SQYD  
last 5 years

# Project Selection

- ◆ Federal Lands has had good success (long-term performance) with CIR/FDR
- ◆ They have proven to be a cost effective, good performing, rehabilitation methods
- ◆ Structural design completed and compared with other rehabilitation alternatives.

# Project Selection

- ◆ Let field investigation guide decision
- ◆ FLHD management and decision-makers present few challenges to in-place recycling use.
- ◆ No cut-offs or pre-set requirements for use – it's an engineering decision

# Candidate for In-Place Recycling

U.S. Department of Transportation  
Federal Highway Administration  
Federal Lands Highway Division

*Engineering America's Scenic Highways*

# Field Investigation for CIR

Reconnaissance	Sampling Frequency	Purpose
Pavement Distress Survey	Project wide	-Document suitability; isolate problem spots
Pavement Layer Depths, Uniformity, Quality	Every $\frac{1}{4}$ -mile	Determine: -Feasibility -Recycling Depth
Subgrade soil	Minimum 1 per mile	-Structural design -Support for equipment

# Field Investigation for CIR

Reconnaissance	Sampling Frequency	Purpose
FWD Survey (not completed on all projects)	300 feet (maximum)	<ul style="list-style-type: none"><li>-Determine subgrade modulus</li><li>-Delineate soft spots</li></ul>
Bulk Pavement Sampling*	As needed to represent differing project conditions	<ul style="list-style-type: none"><li>-Determine mix quality</li><li>-Estimate application rates</li></ul>

\*Completed on projects with marginal conditions and there is a concern about being able to obtain a quality product

# CIR Project Selection

- ◆ Subgrade and base must have the ability to support the recycling train.
- ◆ Adequate Geometrics: minimal steep grades and sharp curves, minimal widening.
- ◆ Consider economy of scale -project size  $> 5$  mi.

# Project Selection- Example

## PAVEMENT REHABILITATION ALTERNATIVES (long-term, structural improvements)

Treatment Type / Method	Life Expectancy	Pros	Cons	Cost/Mile (\$1000s)
<ul style="list-style-type: none"> <li>• 8" Full-depth reclamation (FDR) – stabilized</li> <li>• 2" HACP</li> </ul>	20 – 30 years	<ul style="list-style-type: none"> <li>• Stabilization reduces risk for pumping (and potential for subexcavation overrun)</li> <li>• Reuses/recycles materials</li> <li>• Efficient/smaller "carbon footprint"</li> <li>• Favorable life-cycle costs</li> <li>• Minimal dust</li> </ul>	<ul style="list-style-type: none"> <li>• Contractor availability / mobilization</li> <li>• Slight grade raise</li> <li>• More intensive inspection during construction</li> </ul>	\$600 k
<ul style="list-style-type: none"> <li>• 4" Cold in-place recycling (CIPR)</li> <li>• 3" HACP</li> </ul>	20 – 30 years	<ul style="list-style-type: none"> <li>• History of long-term performance</li> <li>• Reuses/recycles materials</li> <li>• Efficient/smaller "carbon footprint"</li> <li>• Favorable life-cycle costs</li> <li>• No dust</li> </ul>	<ul style="list-style-type: none"> <li>• Contractor availability / mobilization</li> <li>• Treating some base materials</li> <li>• Not suitable for pullouts &amp; parking areas</li> <li>• Grade raise</li> <li>• Subgrade/base may not have sufficient strength to support CIPR train</li> </ul>	\$600 k
<ul style="list-style-type: none"> <li>• Mill 4" of existing material</li> <li>• Recondition base</li> <li>• 4" HACP</li> </ul>	15 – 20 years*	<ul style="list-style-type: none"> <li>• Zero grade raise</li> <li>• Conventional construction / ample contractor availability</li> </ul>	<ul style="list-style-type: none"> <li>• No in-place recycling</li> <li>• Requires 3 separate operations (mill, recondition, pave)</li> <li>• Lower structural value</li> <li>• Requires dust</li> </ul>	\$650 k

# Why complete a design?

- ◆ Fairly compare rehabilitation alternatives & additives
- ◆ Programmatic approach is not practical when you work in all 50 states (much variability)
- ◆ Justify chosen method to client-agency

# FLHD Structural Guidelines

<b>FDR Method</b>	<b>Minimum Thickness of Riding Surface</b>	<b>Typical Structural Coefficient</b>
Mechanical (pulverize)	2" HMA	0.10 – 0.12
Bituminous	Surface Treatment or Structural HMA	0.20 – 0.28
Cement	Surface Treatment or Structural HMA	0.15 – 0.20

# FLHD Structural Guidelines

	<b>Minimum Thickness of Riding Surface</b>	<b>Typical Structural Coefficient</b>
CIR	Surface Treatment or Structural HMA	0.28

See Chapter 11 in the FLH Project Development and Design Manual for further details. Web link:

# CIR Mix Design

- ◆ CFLHD performs a mix design and provides initial application rates -Hveem method (AASHTO Task Force 38)
- ◆ WFLHD determines application rate during test strip
- ◆ Future: Use Superpave Gyratory Compactor? Project underway designed with SGC.

# Performance

- ◆ Performance has exceeded expectations
- ◆ Nearly all of FLHD's CIR projects are still in-service
- ◆ A couple case studies follow...

# FLHD's first CIR Project

- ◆ Location: Rocky Mountain N.P.
- ◆ Year: 1982
- ◆ Typical Structural Section
  - 4 inches CIPR
  - 2 inches HMA
- ◆ CIR Contractor: Valentine Surfacing

# FLHD's first CIR Project

- ◆ Recycling agent: Rejuvenator (Reclamite)
- ◆ Application Rate: 0.9 to 1.2 percent
- ◆ Cost Effectiveness
  - About 40% savings from the alternative to place a 1.5-inch leveling course
- ◆ Elevation: 9,500 to 12,000 feet

# Rocky Mountain N.P. CIR - 1982

# Rocky Mountain N.P. CIR - 1982

# Rocky Mountain N.P. CIR - 1982

Rocky Mountain N.P.  
project ...

...after 26 years!

Rocky Mountain N.P.  
project...

...after 26 years!

# Rocky Mountain N.P. Project - 2007

# First CIR project in California

- ◆ Location: Ice House Road (Eldorado National Forest)
- ◆ Year: 1988
- ◆ Typical Structural Section
  - 4-5 inches CIPR
  - 2 inches HMA
- ◆ CIPR Contractor: Valentine Surfacing

# First CIR project in California

- ◆ Recycling agent: HFMS-2
- ◆ Project length: 13 miles
- ◆ Traffic: 1000 vpd (1988) with heavy logging trucks

# First CIR project in California

20 year &  
counting!

# First CIPR project in California

# First CIR project in California

After 20 years of  
performance...

# Twin Lakes Rd - California

CIR

15 years  
and  
counting

HFMS-2s

09/03/2008

# Grand Canyon – Center Rd

CIR

15 years  
and  
counting

HFE-300s

# Mendocino Pass - California

CIR

12 years  
and  
counting

HFMS-2s

26/05/2008

# Colorado State Hwy 145 (Dolores to Rico)

CIR

10 years  
and  
counting

HFMS-  
2sP

# Big Bend National Park - Texas

FDR and  
double  
chip seal

# Lake Mead N.R.A. - Nevada

FDR with  
6' of  
widening

# Zion National Park - Utah

FDR with  
foamed  
asphalt
