The Sustainable Highway: Implementation of Green Rating Systems within Transportation Infrastructure

*Julie Buffenbarger, LEED AP, Lafarge
Northeast and Mid-Atlantic States In-Place Recycling Conference*

August 24, 2010

Roadways Today

ASCE Grade Card

D- Roads

The number of worldwide paved roads is **15.99 million kilometers** which is almost 20 roundtrips to the moon.

In 97% of the continental United States, you're no more than **three miles from a paved road** of one kind or another.

\$186 Billion is required to just **improve** US highways!

Road Construction Today

The US spends **\$85 billion annually** on rolling out tens of thousands more miles.

Building and maintaining a single mile of freeway

- **Energy use of 200 US homes use** in a year.
- Consumes as much **raw material as 1,000 households** in 365 days
- Generates **more waste than 1200 homes** produce annually.

Environmental Impacts of Transportation

- Transportation was responsible for **27% of total US Greenhouse Gas (GHG)** in 2008.
 - Over the last two decades, transportation has been the **nation's fastest growing GHG source**, responsible for 47% of the net increase in emission between 1990 and 2007.
- Transportation accounts for close to **70% of US oil consumption**.
 - The national driving rate has **increased three times the rate of population growth** since 1970 (driving more miles per capita, more frequently).

Social and Economic Impacts of Transportation

- Americans spend **4.2 billion hours a year stuck in traffic** at a cost to the economy of **\$78.2 billion**, or **\$710 per motorist**.
- Poor road conditions cost motorists **\$67 billion a year** in repairs and operating costs
- And cost **14,000 Americans** their lives.

Sustainability

Sustainability Principles ?

Fundamental Goals and Practices

- Comprehensive Analysis
- **Integrated and Strategic Planning**
- Focusing on Goals, Performance and Outcomes
- **Consideration of Equity**
- Market Principles
- **Precautionary Principle**
- Conservation Ethic
- **Transparency, Accountability and Public Involvement**

The Seven Principles of Sustainable Construction

- Reduce Resource Consumption (Reduce)
- Reuse Resources (Reuse)
- Use Recyclable Resources (Recycle)
- Protect Nature (Nature)
- Eliminate Toxins (Toxins)
- Apply Life-cycle Costing (Economics)
- Focus on Quality (Quality)

Sustainable Design ?

Green Design for buildings has **quickly been integrated** into the building marketplace.

- Various green initiatives including legislation, executive orders, resolutions, ordinances, policies, and incentives are found in **43 states, including 190 Localities (126 cities, 36 counties, and 28 towns), 33 state governments, 13 federal agencies or departments, 16 public school jurisdictions and 39 institutions of higher education** across the U.S.

However, the **requirements for transportation are vastly different** as each project is unique to the region and area in which it is built.

Sustainability ?

Transportation infrastructure is **lagging significantly** behind the commercial and residential building sectors in environmental sustainability.

And in an era of accountability, **the development and acceptance of transportation sustainability performance measures** are long overdue.

What is Sustainable Transportation ?

A comprehensive definition of sustainable transportation system developed by the Canadian Center for Sustainable Transportation states that sustainable transportation:

- “Allows the **basic access needs of individuals** and societies to be met **safely** and in a manner consistent with **human and ecosystem health**, and with equity within and between generations;
- Is **affordable, operates efficiently, offers choice of transport mode, and supports a vibrant economy**; and
- **Limits emissions and waste** within the planet's ability to absorb them, **minimizes consumption of non-renewable, limits consumption of renewable resources** to the sustainable yield level, **reuses and recycles its components**, and **minimizes the use of land and the production of noise.**”

Visions of Sustainable Transportation

- **Technical**

- Innovation to solve specific problems, create wealth and increase mobility (e.g. alternative fuels, super-efficient vehicles)

- **Demand Management**

- Changing travel behavior through travel time, route, mode and destinations by increasing travelers choices

- **Economic Reform**

- Optimal transportation market by reforming prices and investment practices (e.g. full cost pricing, congestion pricing, tax shifting and least cost planning).

- **Alternative Modes**

- Improvements to public transit, ridesharing, non-motorized transport, telecommuting and road design features to promote these modes.

- **Land Use/Community Design Changes**

- Land use pattern changes to reduce travel distances and increase mode choice (e.g. locating more services and jobs near residential neighborhoods, creating neighborhoods more suitable for public transit, walking and cycling.)

Transportation Impacts and Indicators on Sustainability

Economic	Social	Environmental
Traffic Congestion Mobility Barriers Crash Damages Transportation Facility Costs Consumer Transportation Costs Depletion of Non-Renewable Resources	Inequity of Impacts Mobility Disadvantaged Human Health Impacts Community Cohesion Community Livability Aesthetics	Air Pollution Climate Change Habitat Loss Water Pollution Hydrological Impacts Noise Pollution

Economic	Social	Environmental

WISCONSIN and MISSISSIPPI DOTs

- Partnerships with universities to create point-based rating systems.
- Highway centric
- Expectations:
 - Reduced energy use
 - Mitigate environmental burden
 - Human Health and Safety
 - Preservation of Natural Resources
- Both rating systems are under development

Ministry of Transportation Ontario

GREEN PAVE

- Point-based system
- Focus on **Pavement Preservation strategies**
 - Optimizing the use of natural resources
 - Reducing energy consumption
 - Reducing GHG emissions
 - Limiting pollution
 - Improving health, safety and risk prevention
 - Ensuring a high level of user comfort and safety
- Utilizes **LCA and LCCA approach**
 - PaLATE software

Bronze 7-10 points
Silver 11-14 points
Gold 15-19 points
Trillium 20-35 points

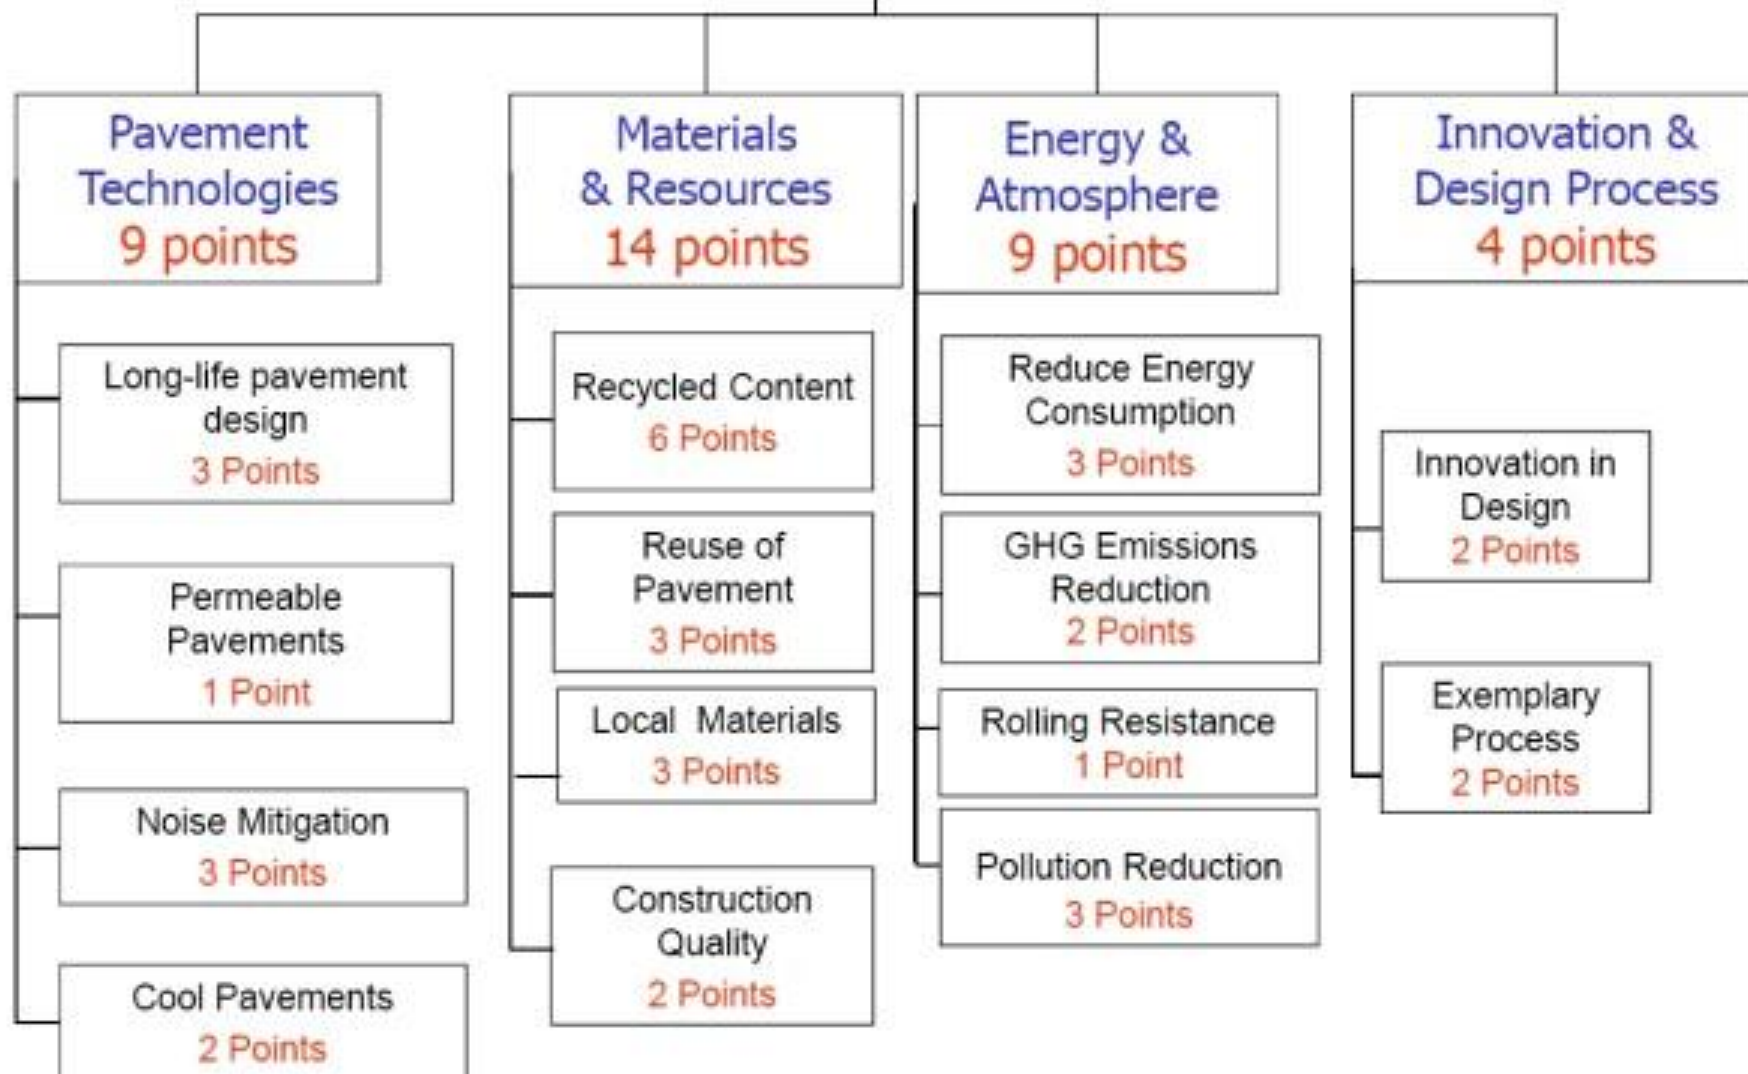

Ministry of Transportation Ontario

Category	Goal	Points
Pavement Design Technologies	To optimize sustainable designs. These include long life pavements, permeable pavements, noise mitigating pavements, and pavements that minimize the heat island effect.	9
Materials & Resources	To optimize the usage/reusage of recycled materials and to minimize material transportation distances.	14
Energy & Atmosphere	To minimize energy consumption and GHG emissions.	9
Innovation & Design Process	To recognize innovation and exemplary efforts made to foster sustainable pavement designs.	4

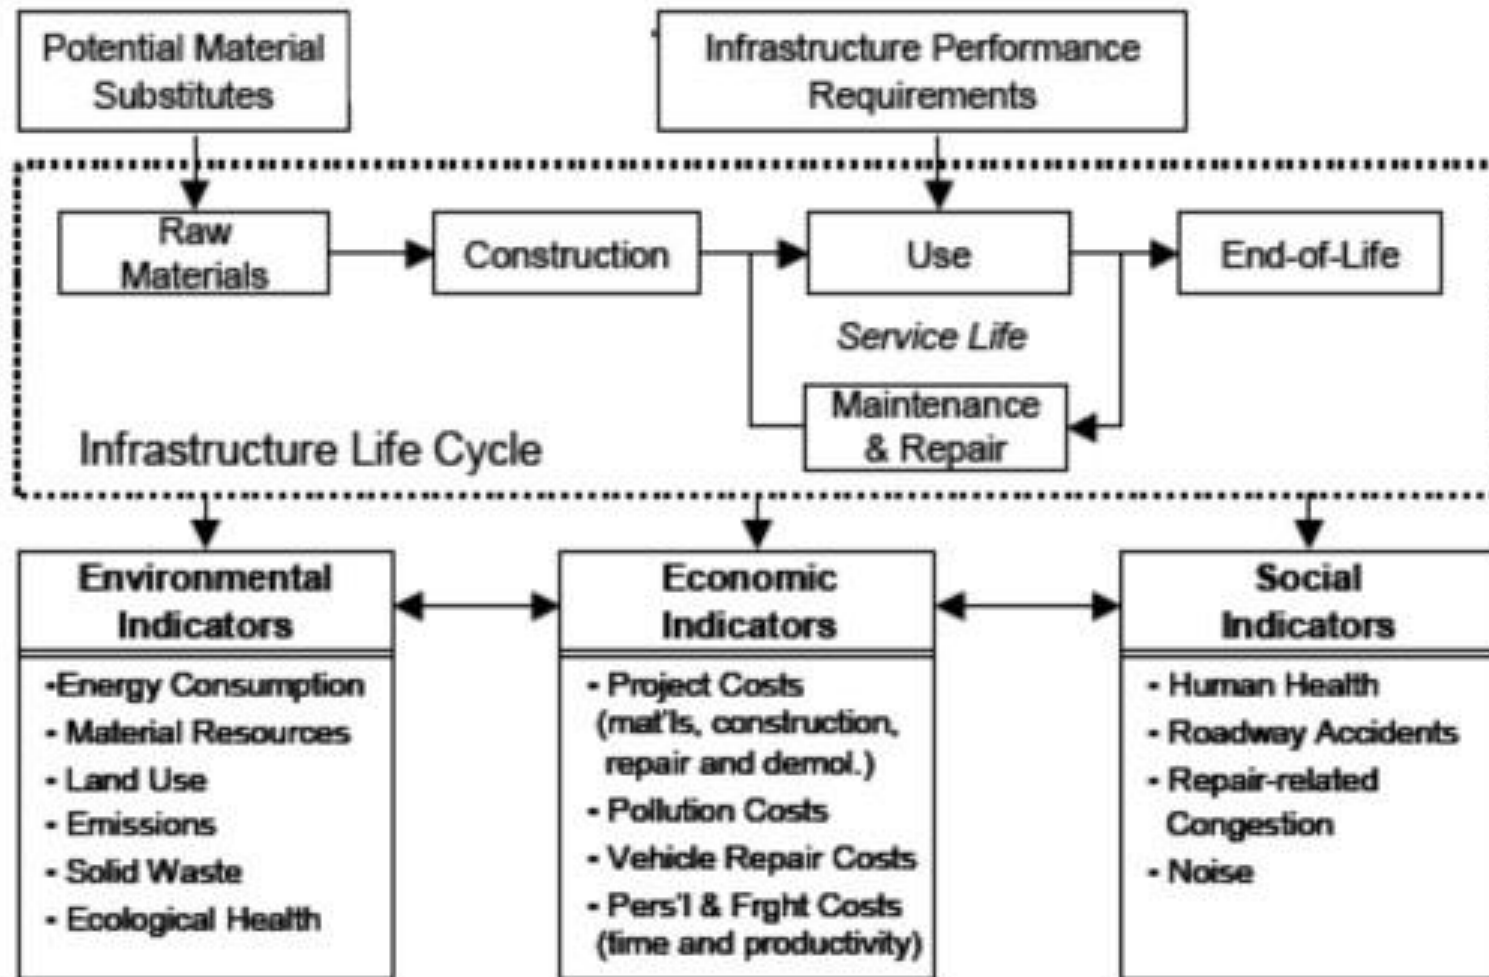

Maximum Total: 36

Performance Measurement/Evaluation Methodologies

STARS – Sustainable Transportation & Access Rating System

- Voluntary Program
- Point-based rating system and planning tool with a “menu” in 6 credit categories
- Based on full life cycle analysis
- Independently verifiable
- Focused on Transportation
 - Projects
 - Employer programs
 - Plans
- Under development

Credit Categories

- Access
- Climate and Energy
- Ecological Function
- Benefit/Cost
- Innovation

Evaluates five strategies:

- Transportation Demand Management
- Transportation Systems Management
- Transit
- Land Use
- New Construction

CEEQUAL – The Civil Engineering Environmental Quality Assessment and Awards Scheme

- Incentive to apply best environmental practices
- Applicable to **all types and sizes of civil engineering projects**
- A point-based assessment scheme for the environmental quality of civil engineering projects
- Assesses *what* is built and *how* it is built
- Scoping, Assessment, Verification and Ratification
- Voluntary Award
- Not a competitive scheme, but an achievement scheme

CEEQUAL – The Civil Engineering Environmental Quality Assessment and Awards Scheme

12 Weighted Schemes

- **Project Management, 10.9%**
- Land Use, 7.9%
- **Energy and Carbon, 9.5%**
- Landscape, 7.4%
- **Material Use, 9.4%**
- The Historic Environment, 6.7%
- **Ecology & Biodiversity, 8.8%**
- Effects on Neighbors, 7.0%
- **Water Resources and the Water Environment, 8.5%**
- Transport, 8.1%
- **Waste Management, 8.4%**
- Relations with the Local Community and Other Stakeholders, 7.4%

Award Grades

Pass $\geq 25\%$

Good $\geq 40\%$

Very Good $\geq 60\%$

Excellent $\geq 75\%$

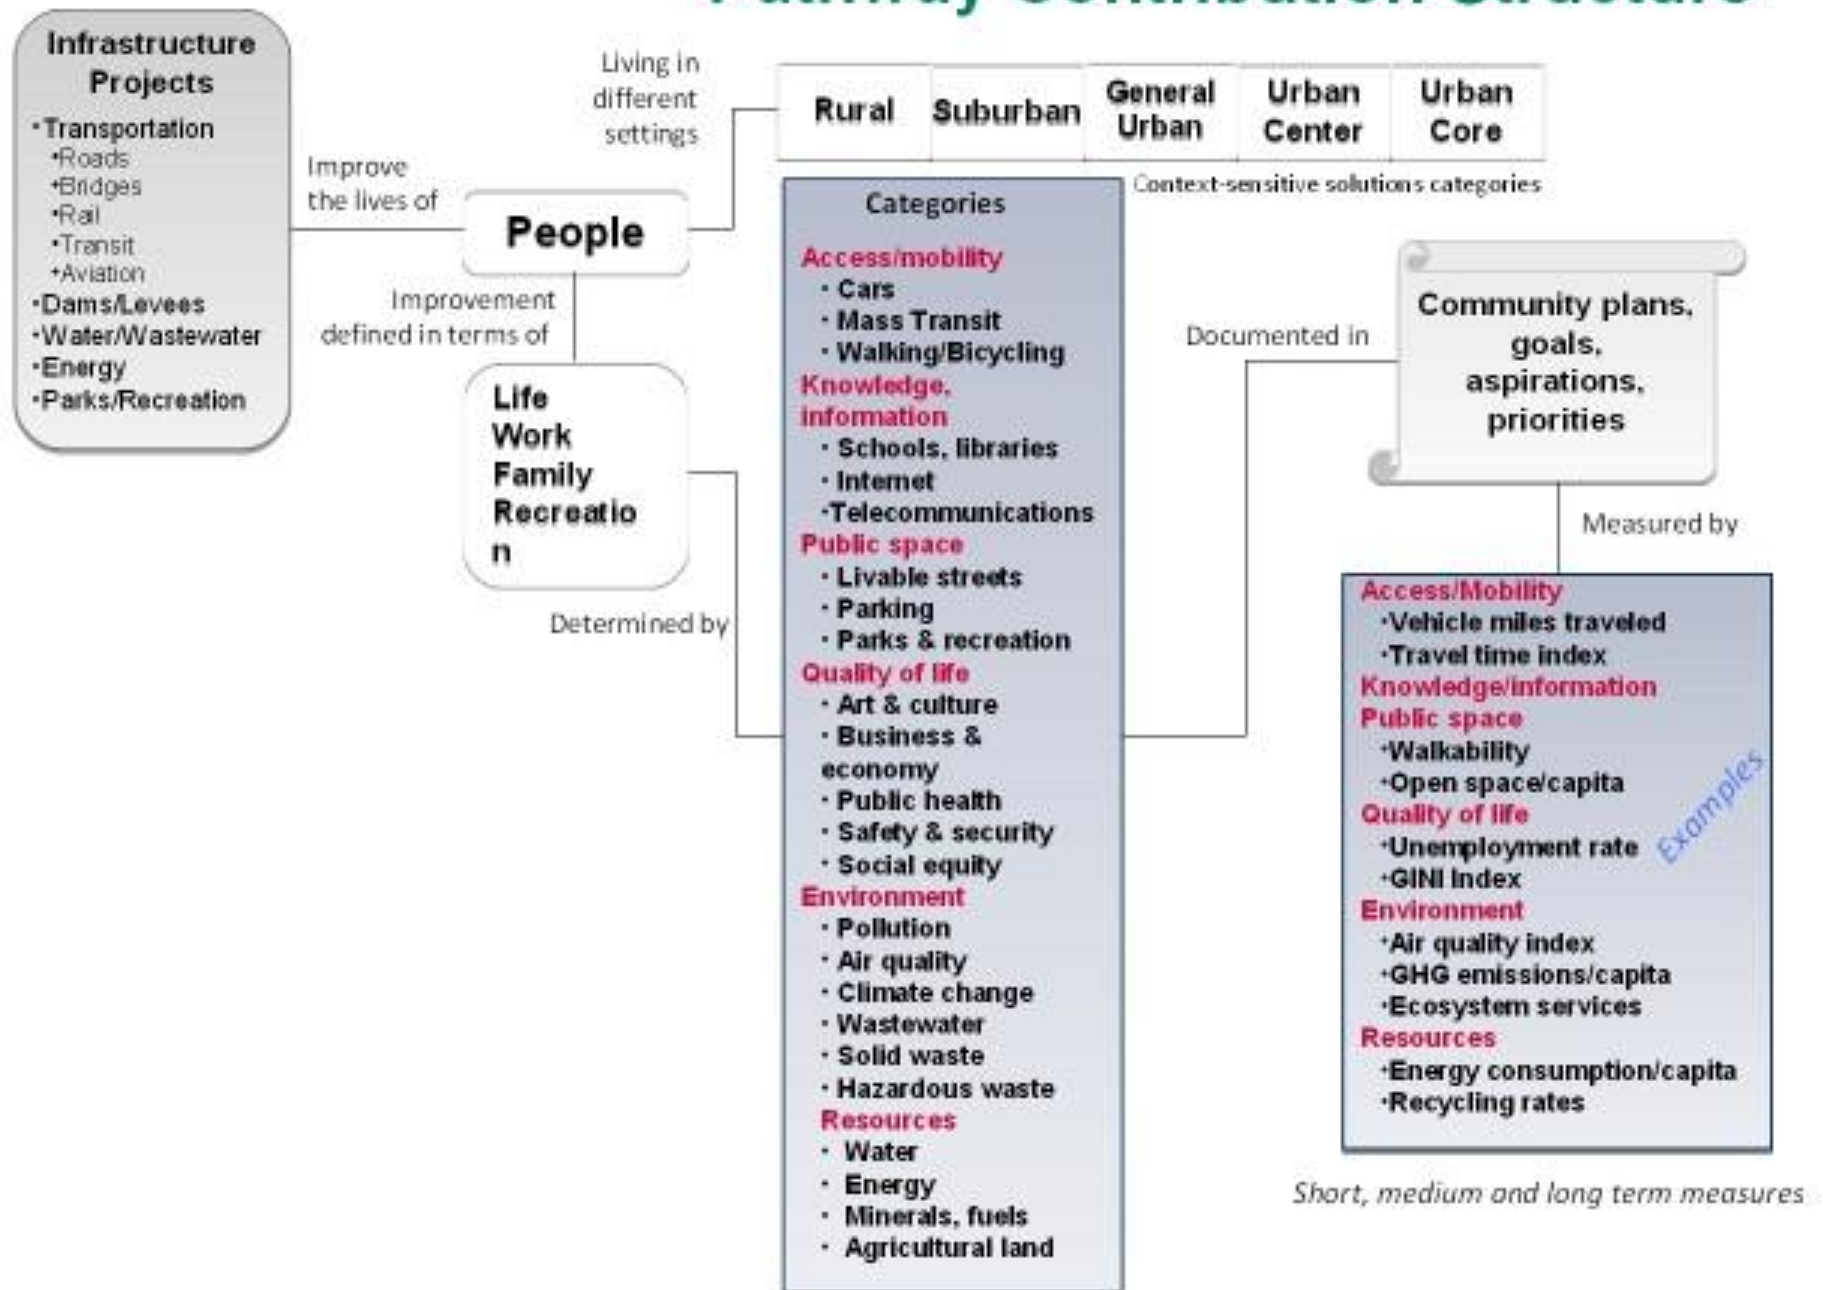

ASCE System Framework

- Guidance, Decision support and Rating
- 12 Sections

- Each has targeted assessment questions arranged in sub-sections

Conclusions

Sustainable Transportation Systems are very similar.

Conclusions

Sustainable transportation planning raises a number of issues regarding the **definition of sustainability and sustainable transportation**, how goals and objectives are defined, evaluated, and the type of decision-making process that should be used.

Sustainability requires **more comprehensive and integrated planning**, which accounts for a **broad set of economic, social and environmental impacts**, including those that are difficult to measure.

Sustainability planning requires **adequate stakeholder involvement to allow diverse perspectives and preferences** to be incorporated.

Conclusions

Sustainability tends to support transportation planning and market reforms that result in more diverse and economically efficient transportation systems, and more compact land use patterns that reduce automobile dependencies.

These reforms help increase economic efficiency, reduce resource consumption and harmful environmental impacts, and improve mobility for non-drivers.

Questions and Discussion
