FP2 Inc.

- Industry supported trade association
- Major sponsors are NAPA, ISSA, AEMA, ARRA, Asphalt Institute, IGGA, Colas, MeadWestvaco, Western Emulsions
- Others supporters are contractors, material suppliers, equipment manufactures, polymer suppliers
Priorities:

- Advocacy for preservation language in the SAFETEA-LU re-authorization
- Promotion of the benefits of pavement preservation
- Support research programs included in the FHWA System Preservation Roadmap
- Financially support the NCPP

Slurry Seals or Microsurfacing are used to weatherproof and delay age hardening caused by oxidation, to maximize the life of existing pavements.
Surface Correction

To restore desirable functional surface characteristics such as:

- Skid resistance
- Crack filling
- Weatherproofing
- Raveling
- Aesthetics and uniformity
Slurry Seals
History of Slurry Seals

✓ Developed in Germany early 1930's
✓ Mix of fine aggregate, binder, water
✓ Novel maintenance technique
✓ Marked the beginning of slurry seals
✓ Made more practical with improved emulsifiers and machinery in 1960's
Description of Slurry Seals

✓ Mixture of asphalt emulsion, graded aggregates, mineral filler & water
✓ Placed on continuous basis
✓ Portland cement, lime, fly ash used
✓ Free flowing consistency
✓ Does not add structural capacity
✓ ISSA - 105
Project Selection for Slurry Seals

- Sound, well-drained bases, surfaces and shoulders
- Free of distresses, potholes, cracking
- Appropriate for:
  - Raveling, Oxidized Pavement w/ Hairline Cracks
- Not Appropriate for:
  - Cracking, Base Failures, Distressed HMA Layers

Slurry Seal:

two primary applications

1. **Pavement Preservation**
   to prevent surface deterioration

2. **Corrective Maintenance**
   to renew surface characteristics

Microsurfacing
History of Microsurfacing

- Developed in Germany late 1960’s
- Thicker version of conventional slurry
- Applied in narrow courses for ruts
- Incorporated special polymers to promote stability in multi-layers
- Introduced in the U.S. in 1980’s
Description of Microsurfacing

“A designed mixture of polymer modified emulsified asphalt, mineral aggregate, mineral filler, water, or other additives, proportioned, mixed, and uniformly spread over a properly prepared surface.”

- ISSA A-143
- State DOT Specifications
- ASTM D-6372
Project Selection for Microsurfacing

- Sound and well-drained surfaces
- No distresses, potholes, and/or cracking
- Appropriate for:
  - Raveling, Oxidized Pavement, Rutting, Rough Pavements w/ Short Wavelengths
- Not Appropriate for:
  - Cracking, Base Failures, Distressed HMA Layers

Microsurfacing Advantages

✓ Mix can be placed in thicker lifts while remaining stable
✓ Macrotecture of the mix remains
✓ Quick setting for traffic
✓ Enhanced durability

Expected Performance

Slurry Seals
- Life Extension 3-5 years (good road)
- Longevity 4 to 7 years

Microsurfacing
- Life Extension 4-8 years (good road)
- Longevity 6 to 10 years
- Rut-filling performance depends on underlying pavement condition
- Traffic is not a limiting factor
